

# Half Fraser Supplement

## PRODUCT INFORMATION

N001-5g - Nalidixic Acid, Powder, 5g

N001-25g - Nalidixic Acid, Powder, 25g

N001-100g - Nalidixic Acid, Powder, 100g

## DESCRIPTION

Fraser Broth Base with Half Fraser Supplement is a primary enrichment broth in the ISO methodology for the detection of *Listeria*

## BACKGROUND

Ammonium ferric citrate is a food additive with E number E381 used as an acidity regulator.

Nalidixic acid is the first of the synthetic quinolone antibiotics. Nalidixic acid is effective against both gram-positive and gram-negative bacteria. In lower concentrations, it acts in a bacteriostatic manner; that is, it inhibits growth and reproduction. In higher concentrations, it is bactericidal, meaning that it kills bacteria instead of merely inhibiting their growth.

## Mechanism of action

## APPLICATION IN FRASER BROTH BASE

Fraser Broth is a modification of the USDA-FSIS (United States Department of Agriculture-Food Safety Inspection Service) UVM secondary enrichment broth and is based on the formula described by Fraser and Sperber. It contains ferric ammonium citrate and lithium chloride. Blackening of the medium is presumptive evidence of the presence of *Listeria*. Contrary to early indications, cultures which do not blacken cannot be assumed to be *Listeria*-free. All Fraser Broth enrichment cultures should be subcultured to plating medium.

The medium is intended for the isolation of *Listeria* spp. from food and environmental samples when used as the secondary enrichment medium in the USDA-FSIS methodology for *Listeria* isolation. It is generally accepted that the USDA-FSIS two stage enrichment method employing UVM primary and secondary enrichment broths is the most suitable for the examination of meat products. Fraser Broth has

proven to be remarkably accurate in detecting *Listeria* spp. in food and environmental samples.

All *Listeria* spp. hydrolyse aesculin to aesculetin. Aesculetin reacts with ferric ions which results in blackening. Another possible advantage to the addition of ferric ammonium citrate is that it has been shown that ferric ions enhance the growth of *Listeria monocytogenes*. Lithium chloride is included in the medium to inhibit the growth of enterococci which can also hydrolyse aesculin. Care must be taken when using Fraser Broth with DNA probe methodology because the high salt content of the medium may have an inhibitory effect on detection.

Half Fraser Broth is a modification of Fraser Broth which contains half of the concentration of nalidixic acid and acriflavine hydrochloride to aid in the recovery of stressed cells. Half Fraser Broth is used as the primary enrichment broth in the ISO methodology for the detection of *Listeria*.

## Content concentrations

Typical Formula*	mg/litre
<b>Fraser Broth Base</b>	
Proteose peptone	5
Tryptone	5
'Lab-Lemco' powder	5
Yeast extract	5
Sodium chloride	20
Di-sodium hydrogen phosphate	12
Potassium dihydrogen phosphate	1.35
Aesculin	1
Lithium chloride	3
Final pH 7.2 ± 0.2 @ 25°C	
<b>Half Fraser Supplement</b>	
Ferric ammonium citrate	500
<a href="#">Nalidixic acid</a>	10
Acriflavine hydrochloride	12.5
* Adjusted as required to meet performance standards	

**Table 1 - Typical Formula for Fraser Broth Base and Half Fraser Supplement**

## METHOD

### Preparation

Suspend appropriate amount of Fraser Broth Base in distilled water and mix well to dissolve completely. Sterilise by autoclaving at 121°C for 15 minutes. Cool

to below 50°C, and aseptically add the contents of Fraser Selective Supplement reconstituted as directed in the product insert. Mix well and distribute into sterile containers.

Suspend appropriate amount of Listeria Enrichment Broth Base in distilled water. Sterilise by autoclaving at 121°C for 15 minutes. Cool to 50°C.

### To Prepare Listeria Primary Selective Enrichment Medium (UVM I)

Aseptically add the contents of Listeria Primary Selective Enrichment Supplement (UVM I) reconstituted as directed. Mix well and distribute into sterile containers.

### To Prepare Listeria Secondary Selective Enrichment Medium (UVM II)

Aseptically add the contents of Listeria Secondary Selective Enrichment Supplement (UVM II) reconstituted as directed. Mix well and distribute into sterile containers.

## Protocol

### Primary Enrichment

1. Inoculate 10ml of Fraser Broth with 0.1ml of the primary enrichment broth (i.e. FDA or UVM I enrichment broth) which has been incubated for 20 to 24 hours.
2. Incubate at 35°C for 26 ± 2 hours in air.
3. Compare each inoculated tube to an inoculated control against a white background. Tubes that darken or turn black should be subcultured on to Listeria Selective Medium or PALCAM Medium. Tubes that retain the original yellow colour should also be inoculated on plating media and confirmed as free from *Listeria* spp. before discarding.

Note: Fraser Medium should be incubated for 26 ± 2 hours to ensure at least 24 hours incubation period to permit the development of the black colour.

### Quality control

Positive control:

*Listeria monocytogenes* ATCC® 7466: Blackening

Negative control:

*Pseudomonas aeruginosa* ATCC® 27853: No blackening
